Mr. Leonard Adams
Government Documents Collection
University Library
Box 34710
University of Massachusetts
Amherst, MA 01003-4710

Dear Mr. Adams:

I have enclosed a copy of the Cape Cod Traffic Counting Report 1993 as you requested. The other books you requested are no longer available for the following reasons:

- All information included in both the Cape Cod Traffic Counting Report 1992 and the Historical Traffic Count Handbook 1991 are included in the Cape Cod Traffic Counting Report 1993.
- This office never published a book entitled Historical Traffic Count Handbook 1992.

If you have any questions please contact me at the Commission at 508-362-3828.

Sincerely,

David Clark
Traffic Engineer

EXECUTIVE SUMMARY

The Cape Cod Commission (formerly the Cape Cod Planning and Economic Development Commission) has completed its tenth year of an ongoing traffic counting program. Over 630 different locations on Cape Cod have been counted since the program began. Each year new locations are counted and many old locations are updated. This has resulted in a useful database of traffic volume information for transportation planning.

In 1993, counts were performed at over 100 different locations. Of these counts, 14 locations were directly comparable with 1992 counts because they were performed at the same location at the same time of the year; an additional 28, performed at the same location but different times of the year, were indirectly comparable through the use of adjustment factors. Of the total of 42 comparable locations, 14 showed decreases while 28 showed increases in daily traffic. Overall, these counts indicated that traffic volumes in 1993 increased by 2.3% over 1992. All 1993 counts are listed in Appendix A. Since the traffic counting program began in 1984, over 300 different locations have been counted more than once. At these locations where comparisons could be made, the data show an average growth rate of approximately 1.9% per year. This corresponds to an overall increase of approximately 18% over the nine year period from 1984-1993.

The traffic counting data are used by local, state, and federal officials; engineers, transportation planners, and many other individuals and organizations. This information is used to perform traffic impact studies for new developments, analyze existing traffic demands on Cape Cod's roads and identify ways to improve traffic flow and safety. The Commission expects to continue to expand and update this important database for transportation planning.

EXECUTIVE SUMMARY

The Office of Management and Enterprise Services (OMES) is pleased to present this report on the results of the 1995-1996 fiscal year. The report provides a comprehensive overview of the state's financial performance, including a detailed analysis of the state's budget, revenue, and expenditures. The report also includes a discussion of the state's economic conditions and the impact of the federal government's actions on the state's economy.

The report is organized into several sections. The first section provides an overview of the state's financial performance, including a discussion of the state's budget, revenue, and expenditures. The second section provides a detailed analysis of the state's budget, including a discussion of the state's revenue and expenditures. The third section provides a discussion of the state's economic conditions and the impact of the federal government's actions on the state's economy. The fourth section provides a discussion of the state's financial performance, including a discussion of the state's budget, revenue, and expenditures. The fifth section provides a discussion of the state's economic conditions and the impact of the federal government's actions on the state's economy.

The report is organized into several sections. The first section provides an overview of the state's financial performance, including a discussion of the state's budget, revenue, and expenditures. The fourth section provides a discussion of the state's financial performance, including a discussion of the state's budget, revenue, and expenditures. The fifth section provides a discussion of the state's economic conditions and the impact of the federal government's actions on the state's economy.

ACKNOWLEDGEMENT

The Cape Cod Commission transportation staff would like to thank the Federal Highway Administration (FHWA), the Massachusetts Highway Department (MHD), and the County of Barnstable for the providing the funding and support for this important transportation planning activity. The following individuals and organizations were instrumental in helping us conduct this work:

Mr. James J. Kerasiotes, Secretary, Executive Office of Transportation & Construction (EOTC)
Ms. Laurinda T. Bedingfield, Commissioner, MHD
Mr. William Steffens, Deputy Commissioner, MHD
Mr. Dan Beagan, Director, Bureau of Transportation Planning and Development (BTP&D),
Mr. David Luce, EOTC, BTP&D
Mr. Richard St. Laurent, EOTC, BTP&D
Mr. Bernard McCourt, MHD District 5 Highway Engineer
Mr. Larry Scialabba, MHD/BTP&D
Mr. Philip A. Hughes, MHD/BTP&D
Mr. Donald Molin, MHD/BTP&D
Mr. John Amato, MHD/BTP&D
Mr. Edward Silva, FHWA
Mr. Thomas Marcello, Town of Barnstable
Mr. John Kuchinski, Town of Yarmouth
Cape Cod Commission
Cape Cod Joint Transportation Committee

Special thanks are also extended to our 1993 seasonal traffic counting technicians Anthony Chiarappo, Victoria Klun, Chad Luce, and Ken Livingston. The technicians were involved in many tasks including the setting out of counters, managing the data, and generating ideas to improve the traffic counting program.

APPENDIX B - TRAFFIC COUNTING DATABASE	22

INTRODUCTION

This report summarizes traffic counts conducted by the Cape Cod Commission between 1984 and 1993. Traffic count locations were selected based on recommendations from the Massachusetts Highway Department (MHD), town officials, members of the Cape Cod Joint Transportation Committee (CCJTC), and the Commission's transportation staff. Since 1989, traffic counts have been conducted with computer-compatible GK5000 counters. These counters have dual input capability which enables the collection of directional traffic volumes, vehicle speeds, or vehicle classification for a particular study. Field data from the counters were transferred directly to main the computer database. Earlier counts were conducted with "paper-punch" traffic counting equipment. Late in the summer of 1993 four new Timemark Delta II counters were purchased. These counters are also computer compatible and have the same capabilities as the GK5000 counters, plus additional features such as the ability to simultaneously conduct a speed and volume study for a particular study location.

Since the traffic counting program began in 1984, the Commission has obtained counts at 639 locations. In 1992, 105 counts were performed. Directional counts were conducted at most of the locations where possible. Directional traffic volume information is important when performing traffic studies because direction of travel can vary significantly by time of day.

A summary table of the traffic counting program's activities is as follows:

Year	New Locations	Total Counts	Year	New Locations	Total Counts
1984	67	67	1989	60	208
1985	49	71	1990	43	173
1986	80	137	1991	47	109
1987	181	284	1992	3	92
1988	100	180	1993	9	105
			Totals	639	1426

USING THE TRAFFIC COUNTING DATA

The traffic counts for each town are contained in the individual data sets by town. There are 14 columns of information for every count location. At locations where directional volumes were obtained, the information is first provided for the total of both directions, directional volumes follow. Counts performed on numbered routes are listed first in numerical order, then named streets are listed in alphabetical order. If a roadway has more than one name (for example, Central Road and North Great Neck Road in the Town of Mashpee), it may be necessary to look under both names for the desired information. Traffic counts which are followed by an asterisk (*) were performed by the MHD or another agency (e.g. the Town of Barnstable's engineering department). These counts are primarily located on Route 6 and roads of local interest. Each column of data is arranged as follows:

TOWN

Beginning with Bourne in the Upper Cape area and ending with Provincetown in the Lower Cape, the towns are listed geographically to provide continuity for the convenience of the reader.

ROUTE

The roadway on which the traffic count was taken.

LOCATION

The orientation of the location with respect to the nearest notable geographic detail. For example: "Rt 3A S of Bour/Plym TL" is shorthand for "Route 3A, south of the Bourne/Plymouth town line." Note that the town line counts are listed twice in the report. For each count location taken at a town line, the count location is located under both town names. This allows for the data to be analyzed more effectively. For a complete listing of the shorthand terms please refer to the Glossary of Abbreviations.

BEGIN DATE and END DATE

These are the dates during which each traffic count was taken. The counts for each location are shown in reverse chronological order, with the most recent count shown first. All locations are not counted every year and some are counted more than once a year. Generally, counts are conducted for a 48-hour period, although some cover longer or shorter periods. Most counts are conducted Monday through Friday during the summer season, in order to monitor summer weekday traffic.

When comparing counts taken in different years, it is important to consider seasonal fluctuations as well as year to year growth. For example, a July 1992 count will generally be higher than an April 1991 count, mainly because of the seasonal differences. Even the comparison of a count performed in July 1992 to June 1991 could be misleading due to the increase in traffic experienced during the months of July or August. On the other hand, if a count is performed in April 1992 shows an increase over a count performed in July 1991, for example the effect is most likely due to area growth.

Other variables to consider when comparing counts are the days of the week in which the counts were performed. Although few counts were performed on Saturdays and Sundays, a comparison of counts in which one was performed over a weekend and the other was only taken during weekdays could be misleading. Therefore, when estimating annual growth in traffic in an area, it is most valid to compare counts taken at the location at the same time of year and on the same type of days (weekday or weekend).

WEATHER

Weather conditions may influence traffic volumes on Cape Cod. Cloudy days often contribute to increased traffic congestion. This occurs for two reasons. First, more people apparently go sightseeing or shopping instead of spending time at one location. Secondly, worse road conditions and poor visibility occur during damp, rainy weather. This reduces the effective capacity of the roads. In the data tables, brief descriptions of weather conditions during the count period are given. This information should be regarded with caution, as weather conditions may change considerably throughout a single day on Cape Cod. Of all the data provided in the tables, this category is the most subjective.

DIRECTION

The Direction identifies the direction of travel for the traffic on the roadway which the data on that line summarizes. The data for the sum of the two directions is listed on the "Both" line. If the count was done on a one-way road, only data for the one direction is listed. If the traffic counter did not separate the counts into the directional movements, only the data for the summation of both directions is listed.

RAW ADT

The Raw Average Daily Traffic is the average 24-hour traffic volume for the time period monitored. Note that all CCC counts are based on axle counts. For example, a 5-axle truck is counted as 2.5 vehicles. This is reasonable since trucks are larger, heavier and slower than cars and reduce the capacity of a given roadway.

PEAK HOUR DATA: Vol, Hour, and Date&Day

The Peak Hour is the highest one-hour traffic volume observed during the period counted. The Volume is listed first, then the hour of the day using 24 hour time (e.g. 16 means that the peak hour occurred beginning at 4 p.m. and ending at 5 p.m.), then the date and day of the week in which the peak occurred.

This information is the most significant for transportation planning because it indicates the highest traffic demands on a roadway and how close a roadway is to its capacity. The two-way peak hour volume is equal to the sum of the two directional peak hour volumes if these occur during the same hour, otherwise the two-way volume is slightly lower than the sum of the directionals. Note that these values are not seasonally adjusted, these are the observed traffic volumes.

Comparisons of peak hour traffic volumes and average daily traffic volumes may provide information on the capacity of a roadway segment. For example, if counts taken in different years or during different months of the same year indicate a change in average daily traffic without a corresponding change in peak hour traffic, this is an indication of capacity constraints during peak times.

FOUR-FIVE

This is the highest traffic volume recorded during the count period which fell between 4-5 PM. It has been included as an aid to transportation planners and engineers. For the years 1984-1993, it was found that, Cape-wide, the peak hour for the entire day generally fell between the hours of 4-5 PM. This was based upon the entire database. As with the other categories of data, the 4-5 PM volume is given for the total of both directions first, and then for each corresponding direction. In many cases, the 4-5 PM volume is also the peak hour for the location. The two-way 4-5 PM volume is equal to the sum of the two directional 4-5 PM volumes if these occur on the same day, otherwise the two-way volume is slightly lower than the sum of the directionals. In addition to planning and engineering purposes, these data are also useful in comparing the peak hour and the 4-5 PM volume for a particular location.

AADT

The annual average daily traffic is calculated from the Raw ADT by multiplying by a "seasonal adjustment factor" for the month of the count. These factors have been calculated from five MHD permanent traffic counting stations on Cape Cod. Note that the year-round ADT is only an estimate, based on seasonal changes in traffic volumes at five locations. A description of the techniques used by MHD to develop the seasonal adjustment may be found in the following section.

SEASONAL ADJUSTMENT FACTORS

The MHD collects year-round traffic volumes from the following permanent traffic counting stations:

- Route 6 near the Barnstable/Sandwich town line
- Route 6 at the Sagamore Bridge
- Route 28 at the Bourne Bridge
- Route 28 in Barnstable, east of Route 130
- Route 3 near the Bourne/Plymouth town line.

Based on the data collected the following Monthly adjustment factors are derived:

	Adj. Factor		Adj. Factor
January	1.37	July	0.75
February	1.32	August	0.76
March	1.29	September	0.90
April	1.08	October	1.01
May	0.94	November	1.14
June	0.87	December	1.21

These factors provide an indication of relative traffic volumes throughout the year. For example, weekday traffic in January is approximately half the weekday traffic in July. Still, there are obvious problems with the data. The permanent stations are on state highways; seasonal traffic fluctuations may be very different on residential streets. Also, none of the permanent stations are located east of Barnstable. This is significant because seasonal traffic fluctuations are generally greater in areas with higher seasonal population changes, such as in the Outer Cape. For a complete listing of all the factors, the table on the following page shows the monthly adjustment factors used to multiply the Raw ADT to determine the AADT. The factors for each month are indicated by the first day of the month (e.g., the July 1989 adjustment factor is listed under 7/1/89).

RESULTS

Traffic counts which were obtained at the same locations in 1992 and 1993 are shown in the table of the following page. The list includes the beginning dates the counts were taken and the annual average daily traffic for both years. These are presented to make comparisons between the traffic volumes of the two years.

Each of the 42 locations in the above list has a growth rate for the 1992-1993 period associated with it. These growth rates are presented graphically in the figure on page 11. The locations are identified along the horizontal axis with numbers corresponding to the above list. The locations are arranged by percentage change from 1992; locations which experienced the greatest decreases are shown on the left of the graph, those with the greatest increases are shown to the right. After weighting the changes by multiplying the growth rates by the traffic volumes, annual average daily traffic volumes were found to increase by 2.32% from 1992 to 1993.

Following the figure are two appendices. Appendix A includes a summary of all of counts obtained in 1993. Appendix B makes up the body of the Report. All counts obtained from 1984 to 1993 are arranged geographically town by town (starting in the Upper Cape area at Bourne and ending in the Lower Cape area at Provincetown).
